Winter Dewatering and Bypass Solutions!

Cold weather conditions can introduce a number of additional challenges to your pumping project.

These can range from preventing lines freezing, to properly maintaining equipment and instrumentation, to having the right operating procedures in place to keep the project flowing safely.

Proper design, planning, equipment selection and operational controls are vital to executing a safe and successful winter dewatering project.

Canada Pump and Power (CPP) currently has a team of experts in Northern Ontario providing dewatering operations in support of mine construction activities. The application requires strict adherence to environmental and quality standards. CPP's operations and engineering groups are able to respond quickly to changing conditions, review and design innovative setups to meet project requirements, and ensure that the documentation and reporting requirements are correct down to the last detail.

Your dewatering project doesn't have to wait for warmer weather. Contact our team today to discuss your next project today.
